

Nötralizasyon Tankı Neutralization Tank

Yoğuşmalı sistemlerde oluşan kondanse suyu nötralize eder. Asidik özelliği artan bu atık suların şebeke veya giderlere gitmeden önce nötralize edilmemesi, mevcut tesisatta ciddi hasarlara yol açabilir.

It neutralizes condensed water formed in condensing systems. Failure to neutralize this increasingly acidic wastewater before it goes to the network or drains may cause serious damage to the existing installation.
